|-----------------------------------------------------------|-----------|
| <b>1. Mathematical programming</b>                        | <b>1</b>  |
| 1.1. Optimization problems and mathematical programs      | 1         |
| 1.2. Linear, integer and quadratic programs               | 2         |
| 1.3. Problem formulation                                  | 3         |
| <b>2. Linear programming</b>                              | <b>1</b>  |
| 2.1. Basic concepts                                       | 4         |
| 2.2. Inequality constraints                               | 6         |
| 2.3. Equality constraints                                 | 6         |
| 2.4. Initial feasible solution and penalty costs          | 7         |
| 2.5. Standard form of the linear problem                  | 8         |
| 2.6. Linear dependence and convex combination of vectors  | 9         |
| 2.7. Convex combinations of vectors and convex sets       | 10        |
| 2.8. Extreme point solution and basic feasible solution   | 10        |
| <b>3. The simplex and the dual simplex methods</b>        | <b>1</b>  |
| 3.1. The simplex method                                   | 12        |
| 3.2. The dual simplex method                              | 17        |
| <b>4. Duality and sensitivity analysis</b>                | <b>20</b> |
| 4.1. Symmetric duals                                      | 20        |
| 4.2. Dual solutions                                       | 20        |
| 4.3. Unsymmetric duals                                    | 21        |
| <b>5. Integer programming: branch-and-bound algorithm</b> | <b>24</b> |
| 5.1. First approximation                                  | 24        |
| 5.2. Branching                                            | 24        |
| 5.3. Bounding                                             | 25        |
| 5.4. Computational considerations                         | 25        |
| <b>6. Integer programming: cut algorithm</b>              | <b>29</b> |
| 6.1. The Gomory algorithm                                 | 29        |
| 6.2. Computational considerations                         | 29        |

---

|                                                                                    |    |
|------------------------------------------------------------------------------------|----|
| <b>7. Integer programming: the transportation algorithm</b> . . . . .              | 31 |
| 7.1. Formulation of the problem . . . . .                                          | 31 |
| 7.2. The transportation algorithm. . . . .                                         | 31 |
| 7.3. An initial feasible solution . . . . .                                        | 32 |
| 7.4. Test for optimality . . . . .                                                 | 33 |
| 7.5. Improving the solution . . . . .                                              | 33 |
| <b>8. Nonlinear programming: single - variable optimization</b> . . . . .          | 34 |
| 8.1. Nonlinear programming: formulation of the problem. . . . .                    | 34 |
| 8.2. Local and global optima. . . . .                                              | 34 |
| 8.3. Sequential - search methods . . . . .                                         | 34 |
| 8.3.1. Three - point interval search. . . . .                                      | 35 |
| 8.3.2. Fibonacci search . . . . .                                                  | 36 |
| 8.3.3. Golden - mean search . . . . .                                              | 38 |
| 8.4. Concave and convex functions . . . . .                                        | 40 |
| <b>9. Nonlinear programming: multivariable optimization without constraints</b> .  | 42 |
| 9.1. Nonlinear programming: formulation of the problem. . . . .                    | 42 |
| 9.2. Local and global optima. . . . .                                              | 42 |
| 9.3. Gradient vector. . . . .                                                      | 42 |
| 9.4. Hessian matrix . . . . .                                                      | 43 |
| 9.5. The method of steepest ascent . . . . .                                       | 44 |
| 9.6. The Newton - Raphson method . . . . .                                         | 47 |
| <b>10. Nonlinear programming: multivariable optimization with constraints.</b> . . | 50 |
| 10.1. Formulation of the problem. . . . .                                          | 50 |
| 10.2. Lagrange multipliers . . . . .                                               | 50 |
| 10.3. The Newton - Raphson method. . . . .                                         | 51 |
| <b>11. Network analysis</b> . . . . .                                              | 56 |
| 11.1. Networks . . . . .                                                           | 56 |
| 11.2. Minimum-span problem . . . . .                                               | 57 |
| 11.3. Shortest-route problems . . . . .                                            | 58 |
| 11.4. Maximal-flow problems . . . . .                                              | 59 |
| <b>References</b> . . . . .                                                        | 68 |
