Preface	9
Part I. Theoretical background	
Chapter 1. Introduction to input-output analysis	17
1.1. Overview	17
1.2. National input-output tables	18
1.3. Construction of WIOD	20
1.4. Basic Leontief input-output model	25
1.4.1. Single-economy case	25
1.4.2. Multi-country framework	29
1.5. Closing input-output model	30
1.6. Supply-driven input-output model	33
1.6.1. Comparing the Leontief and Ghosh input-output models	35
1.6.2. Causal interference in Ghosh model	35
1.6.3. Interpretation as price model	36
1.6.4. Alternative proposals	37
1.7. Dynamic input-output modeling	38
1.7.1. Forms and algebraic solutions	39
1.7.2. Approximating accelerator part in dynamic input-output models	40
1.7.3. Minimizing idle capacities in dynamic input-output model	45
1.7.4. Endogenizing dynamic model with layers of techniques	47
1.8. Summary	53
Chapter 2. Key sector analysis	55
2.1. Overview	55
2.2. Traditional output-oriented linkage measures	56
2.2.1. Importance of interindustry linkages	56
2.2.2. Interindustry linkages from demand- and supply-driven perspectives	57
2.2.3. Ex-post verification versus causal interpretation of IO linkages	58
2.2.4. Idea of backward and forward linkages	59
2.2.5. Traditional and size-adjusted measures of backward and forward linkages	61
2.3. Concept of 'net' linkages	64

2.4. Hypothetical extraction	66
2.4.1. Complete hypothetical extraction measures of backward and forward linkages	66
2.4.2. Incomplete hypothetical extraction measures of backward and forward linkages	67
2.4.3. Policy target variables	68
2.4.4. Further generalizations of partial HE method	70
2.5. Comparison of policy-relevant key sector measures	70
2.6. Linkage-based classification of sectors	71
2.7. Key sector analysis in multi-regional model	73
2.7.1. Finding k -subgroup of key sectors in economy	75
2.7.2. Finding k -subgroup of key regions in multi-regional framework	77
2.8. Summary	78
Chapter 3. Tracing important coefficients in input-output models	79
3.1. Overview	79
3.2. Identifying inverse-important coefficients via SMW formulas	81
3.2.1. Equivalence of SMW-related analytical formulas	84
3.2.2. Concept of 'field of influence'	84
3.2.3. Measuring influence of inverse-important coefficients	85
3.3. Tolerable limit approach	85
3.3.1. Maximum variation margin of Schintke and Stäglin	86
3.3.2. Elasticity-based approach	87
3.3.3. Models based on linear programming	89
3.4. Tracing VARDI coefficients in global framework	91
3.4.1. Data sources	93
3.4.2. Measuring value added in global input-output models	94
3.4.3. Defining VARDI coefficients in global input-output model	95
3.4.4. Tracing VARDI coefficients	96
3.4.5. Choosing constraints – some practical recommendations	100
3.4.6. Existence of global solution	102
3.4.7. Possible extensions and modifications of initial problem	103
3.5. Tracing EEI coefficients in generalized IO models	111
3.5.1. Overview	111
3.5.2. Literature review	114
3.5.3. General approaches to modeling undesirable outputs in DEA context	114
3.5.4. IO-related modifications	115
3.5.5. New concept of tracing EEI coefficients	117
3.5.6. Towards policy implications	121
3.5.7. Indicating EEI coefficients	126
3.5.8. Multiple inputs and outputs	129
3.6. Summary	131

Part II. Key sectors and important IO coefficients in Polish economy: Empirical analysis

Chapter 4. Examining intersectoral linkages: the case of Polish economy	137
4.1. Overview	137
4.2. Results obtained for static IO models	138
4.2.1. Intracountry income backward and forward linkages	139
4.2.2. Intracountry employment backward and forward linkages	148
4.2.3. Income backward and forward linkages in global IO model	156
4.2.4. Employment backward and forward linkages in global IO model	178

4.3. Forecasting intersectoral linkages	192
4.3.1. Simulating backward linkages in intranational IO model for Poland . . .	193
4.3.2. Forecasting backward linkages of Polish sectors in global IO model . . .	202
4.4. Summary	209
Chapter 5. Tracing important input-output coefficients in Polish economy	213
5.1. Overview	213
5.2. Tracing VARDI coefficients for Poland in global IO model	214
5.2.1. General research hypotheses	219
5.2.2. Maximizing Poland's OVAS in global IO model	221
5.2.3. Intranational distribution of value added	223
5.2.4. Measuring sectoral value added in relative-to-global-total terms	225
5.2.5. Intermediate consumption with respect to groups of supplier countries	226
5.2.6. Top VARDI country-sector groups	230
5.2.7. Stability analysis	231
5.3. Identifying OSDI coefficients for Poland in semi-closed global IO model . . .	233
5.3.1. Main empirical results	235
5.3.2. Top OSDI country-sector groups	237
5.3.3. Households sector	238
5.4. Tracing EEI coefficients in Polish economy	240
5.4.1. Measuring eco-efficiency of Polish economy	240
5.4.2. Dataset	242
5.4.3. Direct sectoral indexes of eco-efficiency	243
5.4.4. Linkage-based analysis of eco-efficiency	245
5.4.5. Towards economy-wide policy implications	251
5.4.6. Towards sector-specific policy implications – case study	256
5.5. Tracing EEIC in multi-dimensional framework – illustrative empirical example	260
5.5.1. Direct sectoral indexes of eco-efficiency – case of composite policy goal	
variables	261
5.5.2. Linkage-based analysis of eco-efficiency in multivariate context	263
5.5.3. Towards economy-wide policy implications – multi-dimensional case .	268
5.5.4. Towards sector-specific policy implications – case study in	
multi-dimensional framework	272
5.6. Summary	275
Foreword	281
List of symbols	283
Bibliography	287
